

Vacuum generators VAD/VAK

FESTO

Key features

Product overview

All Festo vacuum generators have a single-stage design and operate according to the Venturi principle. The product series described below have been designed for a wide range of applications.

The different performance classes of the individual product series make it possible to select vacuum generators tailored to suit the specific requirements of each application.

Key features

At a glance

- Compressed air flowing from 1 to 3 generates a vacuum at port 2 in accordance with the ejector principle.
- The low exhaust noise during blowing can be further dampened by using a silencer in port 3.
- Workpieces can be picked up in any position. When the compressed air is switched off, suction stops and the vacuum breaks down.
- During suction with vacuum generator VAK, a volume of approx. 32 cm³ is filled with compressed air; this creates an ejector pulse when the input pressure is switched off, reliably releasing the workpiece from the suction cup.
- Max. switching frequency approx. 10 Hz at 6 bar and approx. 1 m suction line.

Vacuum generator VAD-... without ejector pulse

- Workpieces can be picked up in any position
- Sturdy and resistant to external influences
- Easy to install
- No moving parts, maintenance-free
- Connecting threads and mounting holes available

Vacuum generator VAK-... with ejector pulse

- Quick and reliable setting down of parts via an ejector pulse from a pre-filled reservoir
- Robust vacuum generator for a broad field of applications
- Optional silencer
